BORG ADJUSTABLE JOIST HANGER

The "BAJH" is a re-useable joist hanger system. The system requires far less lumber than conventional decking systems. To prepare a concrete deck form using "BAJH", workers typically space Borg Hangers on two foot centers across concrete or steel beams. Wood joists, up to 13 feet long, are inserted into the adjustable hangers for the length of the deck. Joist dimensions of 2" x 6" through 2" x 12" can be used. The hangers are adjustable to grade and plywood is nailed on top of the joists to complete the form. The concrete deck can then be poured.

No special tools or training are required to use the "BAJH" System. Setup is much faster than other forming techniques.

Teardown is equally fast and efficient. To remove the hangers, the adjustable lower unit loosens via the built-in treaded rod and slides out. The joist can be removed. Clean up is negligible. There is no sacrificial hardware. Hangers and wood joists are immediately available for reuse.
